

CSCI262 - Systems Security

Student Name: Chong Hui Wen

Student ID: 7311436

****Must run in Linux**

****Have to download the openssl library first before compiling**

Compile:

```
$ gcc -std=c99 avltree.h avltree.c helper.h helper.c Rainbow.c -o Rainbow -lssl -lcrypto -lm
```

```
$ ./Rainbow <filename>
```

Additional Notes:

A 'wordlist.txt' and 'rainbow.txt' file has been provided as part of the folder.

Reduction Function Implementation:

To go about doing the reduction function, it takes in an int *i* and a unsigned char pointer *md5_digest*.

With the use of bitwise operators, and bit shifting in order to get the 32-bit width of the message digest,

which is 128-bit/32 byte hex value to decode it to a MD5_LONG type, which is a macro for unsigned int (called *digest_sum*).

After getting the bit sum for the unsigned int (*digest_sum*), I take the value and apply the modulo of 26 to the power of the int

that *i* passed in. The *i* has been defined as a global array with 4 possible values of 12, 8, 6, and 4 based on how many

words the password contains. After doing the calculations to get an integer, I encode the value back to an unsigned

char pointer and return that to be hashed again.

```
[zhixian@zhixian-manjaro A1]$ gcc -std=c99 avltree.h avltree.c helper.h helper.c Rainbow.c -o Rainbow -lssl -lcrypto -lm
[zhixian@zhixian-manjaro A1]$ ./Rainbow Wordlist.txt
Passwords read: 1000
Input Hash Hex: 0c78aef84f66abc1fa1e7477f295d324
DID NOT FIND A MATCH FOR: 0c78aef84f66abc1fa1e7477f295d324
